

Reflo Retention Basics

Retrieval practice asks a learner to recall information without looking at the source.

A confidently graded retrieval attempt can provide evidence about concept mastery.

Reading a lesson is exposure, not proof that the learner can retrieve the concept.

Spacing schedules reviews after time has passed instead of repeating everything immediately.

A review due time should account for the learner time zone and the scheduling algorithm version.

Repeated provider deliveries must reuse one logical delivery so retries do not duplicate attempts.

Grounded lessons and quiz items retain references to authorized source spans.

A source span combines canonical text with stable section and page locators.

An answer outside the authorized source should be rejected instead of silently accepted.

Low confidence short answer grading abstains and offers a multiple choice replacement.

An abstained attempt never changes mastery, confidence, half life, or review count.

Only confident per concept evidence can update those knowledge state fields.

A different re-teach lesson changes strategy, modality, or explanation structure.

Viewing the replacement lesson does not raise mastery; the later re-test supplies evidence.

After bounded failed re-tests, the tutor stops, acknowledges the gap, and schedules review.

Development smoke results are integration evidence, not production release gate evidence.

Target provider security, privacy, quota, quality, and latency gates require authoritative runs.
